

Maximum Metabolism

WEIGHT LOSS PLAN™

What is "The Maximum Metabolism Plan"?

The Maximum Metabolism plan is designed for you to safely:

- ◆ Increase your Basal Metabolic Rate (BMR)
- ◆ Lose excess body fat
- ◆ Build and tone muscles
- ◆ Create a positive change in your appearance
- ◆ Develop healthy lifestyle habits
- ◆ Achieve a greater feeling of personal well-being

The plan embodies a few basic steps for you to achieve the kind of body that you've always known was there. By following these steps toward your personal goal, you'll soon be seeing results, and feeling proud of the healthy new you.

The Maximum Metabolism plan allows you to eat healthy, delicious and filling food – while reducing fat and calories. You'll increase your basal metabolic rate (BMR... the lying down, resting rate) to burn fat more efficiently on a daily basis. You'll develop a simple daily exercise regimen to maintain muscle tone – while still burning more fat. You'll acquire the good habits so all-important in maintaining a leaner, healthy body.

What we "do" is what we "get."

The key to weight-loss is multi-faceted. It embodies more than simply "going on a diet" if you hope to make it permanent. The long-term answer lies in changing our eating habits and exercising properly. (Most of us know how to eat right...we just don't do it.) There are generally deep emotional issues around our being overweight. So a strong "will" and determination is necessary to make the required changes in our lifestyle. That's why it's important for you to decide just how much weight you should lose – not somebody else. It's good to ask for support from those significant others in your life. (Though sometimes those nearest and dearest to you can inadvertently sabotage your earnest efforts to achieve well-being.) So learn to feel good about the steps you are taking towards your goal. Acknowledge yourself every day.

Steps to change your life:

- ◆ Exercise for 20 to 60 minutes, preferably in the morning, 5 to 7 times a week.
- ◆ Eat a low-fat, balanced diet of three meals and two snacks every day.
- ◆ Take a complex multi-vitamin supplement daily.
- ◆ Eat at least two servings of fruit and three servings of vegetables every day.
- ◆ Drink six to eight glasses of water every day.
- ◆ Limit or stop drinking alcohol.
- ◆ Stop eating two to three hours before bedtime.
- ◆ Reach for your walking shoes before reaching for the fridge.
- ◆ Acknowledge yourself and the steps you took towards your goal each day.

What kind of exercise is required?

A combination of a regular walking program with appropriate aerobic and weight exercise is essential for best results. The Maximum Metabolism exercise plan takes only a short time each day, and is designed to help you reduce stress, increase energy levels, burn calories, lose unwanted fat and gain muscle tone. And remember, the more muscle tissue you have...the higher your basal metabolic rate (BMR)...and the more calories you'll burn.

It's best to exercise in the morning so that you get the higher BMR benefit all day long. Another important, though less known, benefit of daily exercise is that it causes the release of endorphins, or "feel good" hormones in the brain.

Walking & aerobics:

Walking has become a very popular aerobic exercise simply because it works. One only needs good shoes, comfortable clothes and several minutes a day. It will improve both leg strength and toning, preserve lean muscle mass, and help you lose fat.

The average optimum walking distance and pace ranges from 1-4 miles a day at about 3-6 miles per hour. This translates to between 10 and 20 minutes to walk one mile. After stretching your leg muscles for a few minutes, start with a short distance and gradually work your way up to longer and more swiftly-paced walks. The object is to walk at a brisk pace, so that you'll start burning calories immediately, and after approximately 18 minutes, begin to burn fat.

Beginner's walking program:

- ◆ Total exercise time: 45 minutes.
- ◆ Warm-up: 3-4 minutes of stretching.
- ◆ Total walk time: 35-40 minutes.
- ◆ Aerobic workout: Mileage - 1.5 miles.
- ◆ Pace: 2.5 miles per hour.
- ◆ Cool-down: 3-4 minutes of after-walk stretches.
- ◆ Frequency: 5 times a week.
- ◆ Weekly mileage: 7.5 miles.

Advanced walking program:

- ◆ Total exercise time: 60 minutes.
- ◆ Warm-up: 5 minutes of stretching.
- ◆ Total walk time: 45-50 minutes.
- ◆ Aerobic workout: Mileage - 3 miles.
- ◆ Pace: 4 miles per hour.
- ◆ Cool-down: 3-4 minutes of after-walk stretches.
- ◆ Frequency: 5 times a week. (You can walk 3 miles a day for 5 days or 2 miles every day.)
- ◆ Weekly mileage: 15 miles.

For a change, you can switch certain days of your walking plan with other aerobic exercises such as jogging, biking or dance aerobic workouts. You can use an exercise bike, rower, treadmill, stepper or swim laps. You could join a health club, or do it with a friend. The point is to exercise regularly on an established, weekly basis.

Weight training.

Another very important aspect to regaining a healthy new you, is getting involved in some form of appropriate weight training. Whether you decide to join a club, or check out some of the excellent books on the subject for in-home use, weight training can be a significant part of your attaining a healthy body. If you wish to regain the same youthful appearance we all previously enjoyed, this is especially true. And it is definitely achievable. We simply need to understand that as we get older and less physically active in our daily lives, it's increasingly necessary to reverse the sedentary process that got us here in the first place.

A good weight training program can rebuild, reshape and continually increase the size of your muscles. Muscle makes you look and feel thinner, as muscles take up 20% less space than fat. Adding muscle will:

- ◆ Raise your metabolism further to melt more fat away.
- ◆ Tighten flabby body areas.
- ◆ Allow you to eat more calories of favorite foods.

So get out there and enjoy your surroundings, the weather, the new day, and a newly emerging healthy you.

The diet program:

The major purpose of the Maximum Metabolism plan is to limit the amount of fat we eat and maximize the amount of healthy nutritional intake. Each week's menu is based on an average of 1400 - 1500 calories a day. Of this, approximately 50% - 60% are carbohydrate, 20% - 25% fat, and 25% - 30% protein calories – with an average of over 22 grams of fiber each day. This level of calories can help you lose weight without slowing your metabolism, or losing muscle mass, as so many of the "starvation" diets do. And since your calorie intake is not being severely restricted, regular aerobic exercise is extremely important to your success.

The plan also includes such serotonin-containing foods as avocado, banana, eggplant, pineapple, plum and tomato that the body naturally uses to control appetite, maintain a positive mood, and feel satisfied after a meal.

A healthy weekly weight loss is about 2 - 3 pounds. More than that could mean you are losing protein (muscle tissue), which you don't want to do.

If your weight plateaus (a common occurrence), you should try to increase daily exercise in terms of time and/or intensity. It's usually a result of water retention, bodily adjustments to weight loss, metabolism and lifestyle changes. You might reevaluate your food intake to make sure you're not getting extra calories from somewhere. And drink plenty of water.

Individuals with a small body frame may want to eat one less snack per day if they find they are not losing 1 - 2 pounds per week.
